campbell biology 9th edition textbook: *The Nature of the Sexes* Tomás Bogardus, 2025-09-15 How complex is sex? According to this book, not nearly as complex as we're often told these days. Author Tomás Bogardus first critically evaluates varieties of a complex view of sex—supported by Anne Fausto-Sterling, Sarah Richardson, and others—in which sex is a constellation of traits related to chromosomes, hormones, gonads, and phenotypes. Bogardus then considers several gamete-based accounts of sex, to which he is more sympathetic, including those from Alex Byrne, Laura Franklin-Hall, and Paul Griffiths. Shortcomings of these views are described, and an improved account is proposed: the sexes are activated higher-order functions. In short, to be male is to have the function of producing sperm, and to be female is to have the function of producing eggs. Bogardus develops this view, all while untangling the various meanings and definitions of 'gender' and 'gender identity', and while examining whether all of them are ultimately defined in terms of the sexes. The author then defends his methodology of deferring to biologists when figuring out the nature of the sexes and concludes with practical questions about whether we should revise the meanings of our sex terms for the sake of social justice. He asks whether pronouns like 'he' and 'she' track biological sex, and whether they should continue to do so. *The Nature of the Sexes: Why Biology Matters* expands current philosophical debate on sex and gender, and is essential reading for curious students and academics alike.

campbell biology 9th edition textbook: Exemplary College Science Teaching Robert E. Yager, 2013-07-17 "Since K-12 students taught using the new [Next Generation Science Standards] will be arriving in college classrooms prepared in a different way from those in our classrooms currently, it would behoove college teachers to be prepared to alter their teaching methods ... or be perceived to be dinosaurs using the older teaching methods." — From Exemplary College Science Teaching If you're looking for inspiration to alter your teaching methods to match new standards and new times, this book is for you. As the first in the Exemplary Science series to focus exclusively on college science teaching, this book offers 16 examples of college teaching that builds on what students learned in high school. Understanding that college does not exist in a vacuum, the chapter authors demonstrate how to adapt the methods and frameworks under which secondary students have been working and make them their own for the college classroom, adding new technologies when appropriate and letting the students take an active role in their learning. Among the innovative topics and techniques the essays in this book explore are • Lecture-free college science teaching • Peer-led study groups as learning communities • Jigsaw techniques that enhance learning • Inquiry incorporated into large-group settings • Interactive video conferences for assessing student attitudes and behaviors The clichéd image of the professor droning on before a packed lecture hall is a thing of the past. The essays in this book explain why—and offer the promise of a better future.

campbell biology 9th edition textbook: *Formal Ontology in Information Systems* P.

Garbacz, O. Kutz, 2014-09-05 Formal Ontology in Information Systems (FOIS) is the flagship conference of the International Association for Ontology and its Applications (IAOA). Its interdisciplinary research focus lies at the intersection of philosophical ontology, linguistics, logic, cognitive science, and computer science, as well as in the applications of ontological analysis to conceptual modeling, knowledge engineering, knowledge management, information-systems development, library and information science, scientific research, and semantic technologies in general. As in previous years, FOIS 2014 was a nexus of interdisciplinary research and communication. The current proceedings is divided into four main sections, dealing with: foundations; processes, agency and dispositions; methods and tools; and applications. The last of these covers a broad spectrum of areas, including in particular biology and medicine, engineering, and economy. For the first time in its history, the conference hosted a special track: an ontology competition, the aim of which was to encourage authors to make their ontologies publicly available and to allow them to be evaluated according to a set of predetermined criteria. Papers discussing these ontologies can also be found in this volume. The book will be of interest to all those whose work involves the application of ontologies, and who are looking for a current overview of developments in formal ontology.

campbell biology 9th edition textbook: André Bazin's Film Theory Angela Dalle Vacche, 2020 Through metaphors and allusions to art, science, and religion, André Bazin's writings on the cinema explore a simple yet profound question: what is a human? For the famous French film critic, a human is simultaneously a rational animal and an irrational being. Bazin's idea of the cinema is a mind-machine where the ethical implications have priority over aesthetic issues. And in its ability to function as an art form for the masses, cinema is the only medium that can address an audience at the individual and community levels simultaneously-- the audience sees the same film, but each individual relates to the narrative in a different way. In principle, cinema can unsettle our routines in productive ways and expand our sense of belonging to a much larger picture. By arguing that this dissident Catholic's worldview is anti-anthropocentric, Angela Dalle Vacche concludes that André Bazin's idea of the cinema recapitulates the histories of biological evolution and modern technology inside our consciousness. Through the projection of recorded traces of the world onto a brain-like screen, the cinema can open viewers up to self-interrogation and empathy towards Otherness. Bazin was neither a spiritualist nor an animist or a pantheist, yet his film theory leads also to ideas of a more cosmological persuasion: through editing and camera movement, cinema explores our belonging to a vast universe that extends from the microbes of the microscope to the stars of the telescope. Such ideas of connectedness, coupled with Bazin's well-known emphasis of realism, form the foundation for his film theory's embrace of Italian neorealism. Choosing to avoid a quantitative naturalism based on accumulation of details, Bazin's theory instead promotes the kind of cinema that celebrates perceptual displacement, the objectification of human behavior, and one's own critical self-awareness.
