

discriminative stimulus examples psychology

Discriminative Stimulus Examples Psychology: Understanding Behavioral Cues in Everyday Life

discriminative stimulus examples psychology are fundamental concepts in behavioral psychology that help us understand how organisms, including humans, learn to respond to specific cues in their environment. Whether it's a dog sitting when it hears a whistle or a student raising their hand when the teacher asks a question, discriminative stimuli guide behavior by signaling when a particular response will be reinforced. This article dives into the world of discriminative stimuli, exploring practical examples, their role in conditioning, and how recognizing these cues can be beneficial in various settings like education, therapy, and even everyday communication.

What Is a Discriminative Stimulus in Psychology?

Before we delve into discriminative stimulus examples psychology, it's essential to clarify what exactly a discriminative stimulus (often abbreviated as SD) is. In operant conditioning, a branch of learning theory developed by B.F. Skinner, a discriminative stimulus is a specific cue or signal that informs an organism that a particular behavior will likely be followed by a reinforcement or reward.

Unlike neutral stimuli or conditioned stimuli in classical conditioning, an SD doesn't elicit a response directly. Instead, it sets the occasion for a behavior to occur because, historically, that behavior has been reinforced in the presence of that stimulus. In simple terms, the discriminative stimulus says, "If you do X now, you're likely to get Y."

Key Characteristics of Discriminative Stimuli

- They indicate the availability of reinforcement or punishment.
- They set the occasion for a particular operant behavior.
- They are learned cues based on past experiences.
- They help organisms adapt their behavior to changing environments.

Understanding these features helps us see how discriminative stimuli function in both laboratory studies and real-world situations.

Everyday Discriminative Stimulus Examples

Psychology in Action

Discriminative stimuli are not just abstract psychological concepts; they are embedded in our daily routines and interactions. Let's explore some relatable examples that illustrate how these cues influence behavior.

1. Traffic Lights and Driving Behavior

One of the most common and straightforward examples comes from traffic signals. When the traffic light turns green, it acts as a discriminative stimulus signaling drivers to proceed because moving forward is reinforced by the benefit of reaching their destination faster. Conversely, a red light signals that stopping is reinforced – drivers avoid penalties like tickets or accidents by halting their vehicles.

Here, the color of the traffic light doesn't directly cause the action but informs drivers about the expected consequences of their behavior. This learning occurs over time through experience and social reinforcement.

2. Classroom Settings

Teachers often use discriminative stimuli to manage classroom behavior and learning. For instance, when a teacher asks, "Who wants to answer this question?", raising a hand becomes a behavior reinforced by praise or recognition. The teacher's question is the SD that signals the opportunity to respond and be rewarded.

Similarly, the sound of a bell or a specific phrase like "Homework time!" can serve as discriminative stimuli that cue students to start or stop certain activities, based on previous reinforcement patterns.

3. Pet Training

Anyone who has trained a dog knows that commands like "Sit," "Stay," or the sound of a clicker act as discriminative stimuli. The dog has learned that responding to these cues with a specific behavior results in a treat or affection.

Interestingly, trainers often use a "release" command as a discriminative stimulus signaling the end of the reinforced behavior, teaching the animal when to stop the current action.

The Role of Discriminative Stimuli in Behavior Modification

Discriminative stimulus examples psychology aren't only useful for understanding behavior but are also central to techniques in behavior therapy and modification. Recognizing and manipulating discriminative stimuli can help shape desirable behaviors or reduce unwanted ones.

Using Discriminative Stimuli in Applied Behavior Analysis (ABA)

Applied Behavior Analysis often employs discriminative stimuli to teach new skills, especially in populations with developmental disorders such as autism spectrum disorder (ASD). For example, a therapist might use a specific card or picture as an SD to prompt a child to request an item. When the child responds correctly, they receive reinforcement.

By systematically controlling these stimuli, therapists can help individuals discriminate between different cues and develop appropriate responses in various contexts, promoting independence and social functioning.

Avoiding Problematic Discriminative Stimuli

Sometimes, problem behaviors are maintained by discriminative stimuli. For example, a teenager might learn that whining only gets attention when a parent is tired or distracted. In this case, the parent's state becomes the SD signaling that whining will be reinforced.

By identifying these cues, parents and therapists can modify the environment to reduce reinforcement for undesirable behaviors, such as by ignoring whining or changing routines.

Discriminative Stimulus vs. Other Behavioral Stimuli

It's useful to distinguish discriminative stimuli from related concepts to get a clearer picture.

- **Conditioned Stimulus (CS):** In classical conditioning, a CS elicits a reflexive response because it has been paired with an unconditioned stimulus. For example, a bell (CS) causing a dog to salivate (response)

after conditioning.

- **Discriminative Stimulus (SD):** In operant conditioning, an SD signals that a particular behavior will be reinforced. It does not directly evoke a response but sets the occasion for it.
- **Stimulus Delta (SΔ):** A stimulus signaling that the behavior will not be reinforced, helping organisms learn when not to respond.

Understanding these distinctions is crucial for interpreting behavioral experiments and real-world learning.

Tips for Identifying Discriminative Stimuli in Your Environment

Sometimes, it's not obvious what cues in your environment are acting as discriminative stimuli, but paying attention can reveal fascinating insights into behavior.

1. **Observe Contexts:** Notice when certain behaviors occur consistently in the presence of specific cues.
2. **Consider Reinforcement History:** Reflect on what consequences follow the behavior and how they might be linked to environmental signals.
3. **Test Behavior Changes:** Change or remove suspected discriminative stimuli and see if the behavior frequency changes.

For example, if you notice that you tend to check your phone only when you hear a notification sound, that sound is likely an SD signaling a possible reward (new message).

Why Understanding Discriminative Stimulus Examples Psychology Matters

Recognizing discriminative stimuli can improve communication, teaching strategies, and behavior management. For educators, it means structuring lessons with clear cues that signal when students should participate or focus. For parents and therapists, it helps in setting up environments that encourage positive behaviors and reduce negative ones.

Moreover, this understanding enhances self-awareness. You might realize that certain environmental cues trigger habits or emotional responses, giving you more control over your actions.

In essence, discriminative stimuli are the subtle behavioral signposts guiding much of what we do daily. By paying attention to these signals, we can better navigate learning, social interactions, and personal growth.

Frequently Asked Questions

What is a discriminative stimulus in psychology?

A discriminative stimulus is a specific stimulus in the presence of which a particular response will be reinforced, signaling that a certain behavior will lead to a consequence.

Can you provide a simple example of a discriminative stimulus?

Yes, a common example is a traffic light: the green light acts as a discriminative stimulus signaling that pressing the gas pedal will result in moving forward without penalty.

How does a discriminative stimulus differ from an eliciting stimulus?

A discriminative stimulus signals the availability of reinforcement for a behavior, whereas an eliciting stimulus automatically triggers a reflexive response without learning.

What is the role of a discriminative stimulus in operant conditioning?

In operant conditioning, a discriminative stimulus indicates when a behavior will be reinforced or punished, guiding the organism to perform or avoid certain actions.

Can verbal commands act as discriminative stimuli?

Yes, verbal commands like 'sit' can serve as discriminative stimuli, signaling to a dog that sitting will be reinforced with a treat.

Is a ringing phone an example of a discriminative

stimulus?

Yes, a ringing phone can be a discriminative stimulus indicating that answering the call will lead to a social interaction or reinforcement.

How do discriminative stimuli influence behavior in everyday life?

Discriminative stimuli help individuals learn which behaviors are appropriate in certain contexts by signaling when specific responses will be rewarded or punished.

What is the difference between an SD (discriminative stimulus) and an S Δ (delta stimulus)?

An SD signals that reinforcement is available for a behavior, whereas an S Δ signals that reinforcement is not available, leading to the suppression of that behavior.

Can environmental cues serve as discriminative stimuli?

Yes, environmental cues like a classroom bell can act as discriminative stimuli, signaling that it's time to change activities or behaviors.

How are discriminative stimuli used in behavioral therapy?

Behavioral therapists use discriminative stimuli to teach clients when specific behaviors will be reinforced, helping to establish or modify desired behaviors.

Additional Resources

Discriminative Stimulus Examples Psychology: Understanding Behavioral Triggers in Context

discriminative stimulus examples psychology form a critical foundation in the study of behavior analysis and learning theory. These examples illuminate how organisms, including humans, learn to associate specific environmental cues with the availability of reinforcement or punishment, ultimately shaping behavior in adaptive ways. The concept of a discriminative stimulus (often abbreviated as SD) is pivotal in operant conditioning, a psychological framework that explains how behaviors are influenced by their consequences.

In psychological terms, a discriminative stimulus signals the opportunity for a particular response to be reinforced. Unlike an unconditioned stimulus that

naturally triggers a response, an SD sets the occasion for behavior because of prior learning history. This subtle but profound distinction underpins much of the research and application in behavioral psychology, from animal training to human therapy and educational practices. By examining discriminative stimulus examples psychology offers, one can better appreciate how behavior is contextually controlled and modified.

In-Depth Analysis of Discriminative Stimuli in Psychology

Discriminative stimuli serve as critical signals in operant conditioning paradigms. They do not elicit behavior directly but indicate that a certain response will be reinforced if performed. This concept was extensively studied by B.F. Skinner, who demonstrated that animals and humans respond to situational cues that predict reinforcement availability.

For instance, a green traffic light functions as a discriminative stimulus for drivers, signaling that pressing the accelerator (the response) will be reinforced by safe passage through an intersection. Conversely, a red light signals that the same response will not be reinforced and likely punished, thereby suppressing the behavior. This example highlights how discriminative stimuli regulate behavior by setting contexts rather than triggering reflexes.

In addition to everyday examples, discriminative stimuli play an essential role in clinical and educational settings. Applied Behavior Analysis (ABA) therapists use discriminative stimuli to teach children with autism spectrum disorder (ASD) new skills by systematically reinforcing appropriate responses to specific cues. The effectiveness of this approach depends on identifying and manipulating discriminative stimuli to encourage desired behaviors and reduce maladaptive ones.

Common Discriminative Stimulus Examples in Psychology

Understanding discriminative stimulus examples psychology requires exploring various contexts where these stimuli function. Below are some illustrative cases:

- **Classroom Settings:** A teacher's instruction, such as "Raise your hand to speak," acts as an SD that signals students to engage in hand-raising behavior, which will be reinforced by gaining the opportunity to speak.
- **Animal Training:** In training dogs, a command like "Sit" serves as a discriminative stimulus signaling that sitting will be reinforced with a

treat or praise.

- **Workplace Environments:** A manager's nod or approval may function as an SD, signaling that certain behaviors, such as completing a task efficiently, will be rewarded.
- **Social Interactions:** A smile or friendly gesture can act as an SD encouraging approach behavior or conversation initiation.

These examples demonstrate how discriminative stimuli are embedded in varied environments, guiding behavior through learned associations rather than innate reflexes.

Discriminative Stimulus vs. Stimulus Generalization

A nuanced understanding emerges when comparing discriminative stimuli with related concepts such as stimulus generalization. While an SD signals the availability of reinforcement for a specific response, stimulus generalization refers to the tendency to respond similarly to stimuli resembling the original discriminative stimulus. For example, a dog trained to sit when hearing "Sit" might also respond to "Sit down," demonstrating generalization.

However, discriminative control is evident when an organism differentiates between stimuli and responds selectively to the SD that reliably predicts reinforcement. This selectivity is crucial for adaptive behavior, ensuring responses are made in appropriate contexts rather than indiscriminately.

Applications and Implications of Discriminative Stimuli

The practical implications of discriminative stimulus examples psychology extend into numerous domains, including behavioral therapy, education, and even marketing.

Behavioral Therapy and Modification

In clinical psychology, particularly in behavior modification programs, identifying and manipulating discriminative stimuli can facilitate behavior change. For instance, therapists might use specific cues to reinforce positive behaviors in patients recovering from addiction or managing anxiety disorders. By controlling the discriminative stimuli, therapists help patients learn when certain responses are appropriate and likely to be

reinforced, promoting healthier behavioral patterns.

Education and Learning

Educators leverage discriminative stimuli to shape classroom behavior and enhance learning. Clear signals, such as raising a hand or responding to a bell, can serve as SDs that help students understand when particular behaviors, like paying attention or transitioning between tasks, will be reinforced. This structured environment aids in maintaining order and promoting effective learning.

Marketing and Consumer Behavior

Marketers exploit discriminative stimuli to influence consumer behavior. For example, promotional cues like sales signs or brand jingles act as SDs that signal the availability of rewards such as discounts or quality products. Consumers learn to associate these stimuli with positive outcomes, which can trigger purchasing behavior.

Critical Features and Challenges in Identifying Discriminative Stimuli

Identifying true discriminative stimuli can be complex because environmental cues often coexist with other stimuli, some of which may be irrelevant or exert competing influences on behavior. Discriminative stimuli must satisfy specific criteria:

1. They must precede the behavior.
2. They signal that reinforcement or punishment is contingent on the behavior.
3. They increase the likelihood of the behavior only when reinforcement is available.

This differentiation requires careful experimental design and observation, especially when multiple stimuli are present.

Moreover, discriminative stimuli may sometimes inadvertently reinforce maladaptive behaviors. For example, a student who receives attention only when acting out may learn that disruptive behavior is reinforced by social cues, serving as SDs despite negative consequences. Therapists and educators

must be vigilant in recognizing such patterns to restructure environmental cues effectively.

The Role of Discriminative Stimuli in Habit Formation

Discriminative stimuli are also implicated in habit formation, where environmental cues trigger automatic behaviors. For instance, the sound of a coffee machine might serve as an SD prompting a habitual coffee-making routine. Understanding these stimuli can assist in designing interventions to break harmful habits or cultivate beneficial ones.

Research indicates that manipulating discriminative stimuli can be more effective than attempting to alter the behavior directly, as changing the environmental triggers can reduce the likelihood of undesirable responses.

Emerging Research and Future Directions

Recent studies in neuroscience and behavioral psychology are uncovering the neural correlates of discriminative stimulus control, illustrating how brain regions process environmental cues to regulate behavior. Advances in technology, such as virtual reality, offer novel methods to study discriminative stimuli in controlled yet ecologically valid settings.

Furthermore, integrating discriminative stimulus concepts with cognitive and emotional factors promises a more holistic understanding of behavior regulation, particularly in complex human environments.

By exploring discriminative stimulus examples psychology continues to evolve, providing valuable insights into behavioral mechanisms and practical tools for intervention across various fields. This ongoing investigation deepens our grasp of how subtle environmental cues shape the tapestry of human and animal behavior.

Handbook Stephen F. Davis, William Buskist, 2008 Highlights the most important topics, issues, questions, and debates in the field of psychology. Provides material of interest for students from all corners of psychological studies, whether their interests be in the biological, cognitive, developmental, social, or clinical arenas.

discriminative stimulus examples psychology: Exercise Psychology Janet Buckworth, Rod K. Dishman, 2002 In this in-depth examination of the relationship between exercise and psychological constructs information is presented from a wide variety of disciplines, including neuroscience and public health.

discriminative stimulus examples psychology: A Guide to Teaching Introductory Psychology Sandra Goss Lucas, 2009-01-22 A Guide to Teaching Introductory Psychology focuses on the critical aspects of teaching introductory psychology to undergraduate students. It includes ideas, tips, and strategies for effectively teaching this course and provides useful answers to commonly asked questions. A concise and accessible guide to teaching introductory courses in Psychology Begins with an orienting history of the course· Evaluates current trends in teaching and offers suggestions for developing personal techniques Addresses a number of relevant issues, including how to teach difficult topics; linking course content to everyday experience; developing and using class presentations, lectures, and active learning ideas; and increasing interest in course topics Supported by a website that provides links to useful websites and handouts that instructors can use in their classes (<http://www.blackwellpublishing.com/teachpsychscience/lucas/>)

discriminative stimulus examples psychology: The Handbook of Intellectual Disability and Clinical Psychology Practice Alan Carr, Christine Linehan, Gary O'Reilly, Patricia Noonan Walsh, John McEvoy, 2016-04-12 The Handbook of Intellectual Disability and Clinical Psychology Practice will equip clinical psychologists in training with the skills necessary to complete a clinical placement in the field of intellectual disability. Building on the success of the previous edition this handbook has been extensively revised. Throughout, the text, references, and website addresses and have been updated to reflect important developments since the publication the first edition. Recent research findings on the epidemiology, aetiology, course, outcome, assessment and treatment of all psychological problems considered in the book have been incorporated into the text. Account has been taken of changes in the diagnosis and classification of intellectual disability and psychological problems reflected in the AAIDD-11 and the DSM-5. New chapters on the assessment of adaptive behaviour and support needs, person-centred active support, and the assessment of dementia in people with intellectual disability have been added. The book is divided into eight sections: Section 1: Covers general conceptual frameworks for practice - diagnosis, classification, epidemiology and lifespan development. Section 2: Focuses on assessment of intelligence, adaptive behaviour, support needs, quality of life, and the processes of interviewing and report writing. Section 3: Covers intervention frameworks, specifically active support, applied behavioural analysis and cognitive behaviour therapy. Section 4: Deals with supporting families of children with intellectual disability, genetic syndromes and autism spectrum disorders. Section 5: Covers issues associated with intellectual disability first evident or prevalent in middle childhood. Section 6: Deals with adolescent concerns including life skills training, relationships and sexuality. Section 7: Focuses on residential, vocational and family-related challenges of adulthood and aging. Section 8: Deals with professional issues and risk assessment. Chapters cover theoretical and empirical issues on the one hand and practice issues on the other. They close with summaries and suggestions for further reading for practitioners and families containing a member with an intellectual disability. Where appropriate, in many chapters, practice exercises to aid skills development have been included. The second edition of the Handbook of Intellectual Disability and Clinical Psychology Practice is one of a set of three volumes which cover the lion's share of the curriculum for clinical psychologists in training in the UK and Ireland. The other two volumes are the Handbook of Child and Adolescent Clinical Psychology, Third Edition (by Alan Carr) and the Handbook of Adult Clinical Psychology Practice, Second Edition (edited by Alan Carr & Muireann McNulty).

discriminative stimulus examples psychology: A Student's Guide to Studying Psychology

Thomas M. Heffernan, 2000 Updated and extended, this new edition of the very popular and practical guide to studying psychology remains an invaluable tool for students at both undergraduate and pre-degree level.

discriminative stimulus examples psychology: *A Primer of Human Behavioral Pharmacology* Alan Poling, 2013-06-29 vii Drugs and sex are two topics about which most people have strong opinions and weak understanding. Knowledge of each can be gained in many ways, all with associated rewards and risks. Like all textbooks, this one was written in the belief that reading can foster learning. The book is intended to introduce principles of behavioral pharmacology to readers with little or no knowledge of the discipline but with an interest in how drugs affect human behavior. Gleaning anything of value from the text requires two things from the reader. The first is a willingness to accept an analysis of drug effects that shares little with folklore or common sense notions of drug action. The second is a willingness to accept the fact that the behavioral effects of drugs are complex and depend upon a sizable number of pharmacological and behavioral variables. Unless one is aware of these factors and how they determine a drug's actions, the behavioral effects of drugs can be neither predicted nor meaningfully explained. If it does nothing else, this volume will make it obvious that the behavioral effects of drugs are lawful and can be predicted and understood on the basis of well-established relations between empirical phenomena. Describing these relations and exploring how they allow behavioral pharmacologists to make sense of drug effects that are otherwise incomprehensible was a major goal in preparing the text.

discriminative stimulus examples psychology: Relational Frame Theory Steven C. Hayes, Dermot Barnes-Holmes, Bryan Roche, 2005-11-30 This volume goes beyond theory and gives the empirical and conceptual tools to conduct an experimental analysis of virtually every substantive topic in human language and cognition, both basic and applied. It challenges behavioral psychology to abandon many of the specific theoretical formulations of its most prominent historical leader in the domain of complex human behavior, especially in human language and cognition, and approach the field from a new direction. It will be of interest to behavior theorists, cognitive psychologists, therapists, and educators.

discriminative stimulus examples psychology: *Dictionary of Psychology* Mike Cardwell, 2014-01-27 Psychology as a subject is notorious for its often confusing use of language, particularly as many words that have one meaning in common everyday language have quite a different meaning when used as specialist terms in psychology. *Dictionary of Psychology* is an A-Z guide to key terms in the subject. Each entry begins with a clear, one-sentence definition and is followed by explanation and examples. Entries are developed in line with the relative importance of the topic covered. For many of the more central topic areas, further commentary is included to assist the reader in acquiring a critical understanding of the topic in question. Entries are carefully cross-referenced, and the format makes the *Dictionary of Psychology* very easy to use.

discriminative stimulus examples psychology: *The Dictionary of Psychology* Mike Cardwell, 1999 First published 1996 in the United Kingdom by Hodder and Stoughton Educational as 'The complete A-Z psychology handbook'--T.p. verso.

discriminative stimulus examples psychology: The Handbook of Child and Adolescent Clinical Psychology Alan Carr, 2025-06-02 Now in its fourth edition, *The Handbook of Child and Adolescent Clinical Psychology* incorporates important advances in the field to provide a practice-oriented and accessible resource for clinical psychologists in training. Beginning with a set of general conceptual frameworks for practice, the book gives specific guidance on the management of problems commonly encountered in clinical work with children and adolescents, drawing on the best practice in the fields of clinical psychology and family therapy. There is comprehensive coverage of Problems of infancy and early childhood Problems of middle childhood Problems of adolescence Child abuse Adjustment to major life transitions including entering foster care, parental divorce, and bereavement Each chapter dealing with specific clinical problems includes cases examples; discussion of diagnosis, classification, epidemiology, clinical features, assessment, and treatment; and practice exercises. New material includes the latest advances in child and adolescent clinical

psychology assessment and treatment programmes and positive psychology. It also is updated in line with the latest revisions of ICD and DSM. This book is invaluable as both a reference work for experienced practitioners and as an up-to-date, evidence-based practice manual for clinical psychologists in training.

discriminative stimulus examples psychology: The Oxford Handbook of Cognitive and Behavioral Therapies Christine M. Nezu, Arthur M. Nezu, 2016 The Oxford Handbook of Cognitive and Behavioral Therapies provides a contemporary and comprehensive illustration of the wide range of evidence-based psychotherapy tools available to both clinicians and researchers. Chapters are written by the most prominent names in cognitive and behavioral theory, assessment, and treatment, and they provide valuable insights concerning the theory, development, and future directions of cognitive and behavioral interventions. Unlike other handbooks that provide a collection of intervention chapters but do not successfully tie these interventions together, the editors have designed a volume that not only takes the reader through underlying theory and philosophies inherent to a cognitive and behavioral approach, but also includes chapters regarding case formulation, requisite professional cognitive and behavioral competencies, and integration of multiculturalism into clinical practice. The Oxford Handbook of Cognitive and Behavioral Therapies clarifies terms present in the literature regarding cognitive and behavioral interventions and reveals the rich variety, similarities, and differences among the large number of cognitive and behavioral interventions that can be applied individually or combined to improve the lives of patients.

discriminative stimulus examples psychology: *Handbook of Psychology: Biological psychology* Irving B. Weiner, Donald K. Freedheim, 2003 Includes established theories and cutting-edge developments. Presents the work of an international group of experts. Presents the nature, origin, implications, an future course of major unresolved issues in the area.

discriminative stimulus examples psychology: *Principles of Behavior* Richard W. Malott, Joseph T. Shane, 2015-10-02 This book serves as a general, liberal-arts introduction to behavior analysis, as well as a first step in becoming a professional behavior analyst at the BA, MA, or the PhD/EdD level. It presents various case studies and examples that help readers to apply principles of behavior to real life.

discriminative stimulus examples psychology: The Student's Guide to Studying Psychology Thomas M Heffernan, 2015-06-19 Studying a degree course in psychology, even if you've taken the subject before university, requires a whole range of new skills and knowledge. And the 4th edition of this best-selling guide is an invaluable companion. It can not only help you to get a good final degree, but will also support you in making informed choices towards either a career or further study. Updated to include the latest developments in the field, the new edition provides practical and helpful guidance on everything a psychology student encounters throughout their degree, including: Writing essays and research reports, including how to get your referencing right. Guidelines for researching ethically using humans or animals An overview of research methods and statistics, including qualitative methods Tips on how to approach and pass your exams Advice on becoming a graduate, including preparing your CV and making the most of your degree Featuring advice to help you every step of the way, the book also includes a library of weblinks to provide further resources to support your studies. This is an essential book for any psychology student wishing to make the most of their degree course.

discriminative stimulus examples psychology: The Science of Learning Joseph J. Pear, 2014-01-02 Growing at an ever-increasing pace for over a century, the solid body of concepts and facts that constitute the science of learning demand a comprehensive, systematic introduction. Completely up-to-date and written in a direct, easy-to-read style that is suitable for undergraduates, The Science of Learning is such an introduction. Because its focus is on what is known rather than what is speculated, this book differs from other learning texts by not dwelling on which theories are or are not in vogue. The text's comprehensive coverage makes it an ideal reference for more advanced scholars and specialists in learning and related fields.
